

URBAN TRACK SYSTEM

Trust layer of urban development

Cross-confirmed experience, permanent professional identity,
and certified CVs for urban experts

Client Presentation — August 2026

Python (Django) • Tailwind CSS • PostgreSQL-ready • Trust & certification

Agenda

- **Why we built it** — the problem behind Urban Track
- The solution in a nutshell
- **What's live today** — real modules & screens
- How trust gets certified
- Project portfolios, galleries & reports
- Branded email notifications
- **Status** — everything is built; ready for migration to the cloud

One message in a nutshell: the platform works today — and it's built on verifiable trust, not on claims taken at face value.

The problem we set out to fix

Working in urban development in Africa is held back by a lack of trust:

- **CVs that are hard to believe** — no easy way to check what an expert really did; references rarely get followed up.
- **Credit that gets lost** — big firms take the credit while the individuals who actually did the work stay invisible.
- **Data that stays siloed** — agencies (World Bank, EU, AFD) don't share their records, so finding the right person is guesswork.

What that costs people:

- Hours lost searching for qualified consultants
- Hiring mistakes and expertise that can't be verified
- Talented professionals who never get the recognition they earned

Our goal: bring clarity, transparency and trust to urban expertise across Africa.

How trust gets built

1. Identity Every expert gets a permanent 0X-XXXXXX number that stays with them for life.

2. Cross-checking Nothing gets certified unless a second party confirms it, by email, first.

3. Trust score Confirmed work is weighted by role into one transparent, auditable score.

Identity first. then cross-confirmation. then certification – nothing is taken at face value.

Delivery at a glance

10

data models

36

URL routes

51

templates

6

application
modules

183

automated tests

100%

core features live

It all works end-to-end today — from sign-up to a permanent OXID, cross-confirmed trust scores, project galleries, certified CVs and a working job marketplace.

accounts

Identity, roles,
OXID, profiles

certification

Trust score & confirms

projects

Portfolio, gallery, docs

jobs

Board, apply, tracking

One Django application, six focused modules — backed by 183 passing tests.

The platform in action — real screenshots

Home — trust-first public landing

Job board — public opportunities

Expert profile — OXID, skills & portfolio

Dashboard — expert workspace

One identity, three roles

Each role sees what it needs

- **Expert** — builds a profile and applies to missions
- **Company** — posts opportunities and confirms contributions
- **Admin** — keeps everything validated and in check

One permanent professional ID (OXID)

- Auto-generated, never changes: 0X-XXXXXX
- Becomes a shareable public URL, e.g. /experts/0X-PNH3RM/

Profiles people can build and keep updating:

- Name, title, bio, location, website, LinkedIn
- Avatar upload, with automatic fallback
- Skills with easy tagging
- A public profile view counter
- Availability status and hourly/daily rates

Expert search & discoverability

Find the right expert fast

- Public **expert directory** and **search**
- Matches by name, email and OXID
- Public profile URLs shareable beyond the platform
- Cross-confirmed experience shown prominently

Trust score — the auditable differentiator

- Director 4 / Manager 3 / Specialist 2 / Assistant 1
- Weights only **certified** contributions
- One definition shared by the whole platform

Why this matters:

- Verifiable credibility replaces self-reported CVs
- Companies hire with confidence
- Talented experts gain the recognition they deserve

Every point of a trust score traces back to a confirmed contribution. Transparency is the product.

Certification & the cross-confirmation workflow

How a claim becomes certified

- An expert (or company) declares a contribution on a project
- The system generates an **invitation** with a secure magic link
- A second party confirms via a branded email
- Only **confirmed** contributions feed the trust score
- Full status lifecycle: proposed → confirmed (or declined)

A magic link in a branded email is the trust anchor. Nothing is certified without a second party.

CV builder & portfolio

A complete, professional CV generator

- Interactive builder at /cv/
- **PDF export** via WeasyPrint • browser print option
- Bilingual labels (French & English) in exports
- Multiple visual skins
- **Automatic experience:** an accepted application is added to the expert's CV automatically

Project portfolio:

- Project model with description, category, date, skills
- Rich gallery with media & documents
- Shown on the dashboard and public profile
- Company works & portfolio pages

Trust at every step: every CV claim can be traced back to a confirmed project.

Project portfolio — gallery & documents

Project detail — gallery, media and report documents

Rich project pages

- Public **project directory**
- Detailed project pages with rich descriptions
- **Media gallery** with CSS-only **lightbox**
- Real images from the project portfolio
- Downloadable **report documents** (PDF)
- Company **works** pages

Projects are no longer placeholders — they showcase real images and deliverable reports.

Jobs, applications & the marketplace

Job / opportunity board

- Six types: Opportunity, Proposal, Consulting, Project, Training, Research
- Public job board / jobs /
- Required skills, budget range, duration, location
- Status lifecycle: Open → In progress → Closed
- Validation: Pending / Validated / Rejected

Application workflow

- Apply with an optional cover letter
- Applicant counter in real time
- Company accepts / rejects applicants
- Duplicate-application prevention
- **Accepted** → **experience auto-added to CV**

Branded email notifications

A complete, on-brand notification system

- All emails rendered as branded HTML templates
- Real localhost links and action buttons
- **15+ email workflows** tested end-to-end:
 - Certification invitations & confirmations
 - Job application received & decision
 - Job deadline reminders (company & expert)
 - Company revalidation, expert update, reminders

Where emails drive trust:

- Confirmation links certify contributions
- Smart default (SITE_BASE_URL) for local links
- **HTML base template** reused by every workflow
- SMTP configured (SSL, port 465)

Email is not an add-on here — it is the mechanism that makes cross-confirmation real.

Dashboards & administration

Role-based dashboards

- **Expert:** profile views, projects, CV summary, application tracking
- **Company:** job overview, applicant stats, recent listings
- **Admin:** statistics, active users, latest jobs, experts and applications

Professional error pages

- Branded, on-brand 400/403/404/500 pages
- Custom handlers wired in `urls.py`
- Tested (**183 tests** cover the full platform)

Admin panel — full control

- Admin interfaces covering every model
- User, expert, CV and certification management
- Job validation and application status tracking

Every module is configurable from the admin panel — no code needed.

Where the project stands today

Module	Status	Scope	Comment
Identity & multi-role accounts	LIVE	Core	Expert / Company / Admin
Permanent professional ID (OXID)	LIVE	Core	Free, permanent identifier
Expert search & directory	LIVE	Core	Name / email / OXID
Trust score & certification	LIVE	Core	Cross-confirmed via email
CV builder & PDF export	LIVE	Core	Bilingual, WeasyPrint
Project portfolio & gallery	LIVE	Core	Lightbox + report documents
Job board & applications	LIVE	Core	Full lifecycle, CV auto-update
Application & job & project CRUD	LIVE	Core	Full C.R.U.D.
Account settings & profile picture	LIVE	Core	Password change, avatar
Branded email notifications	LIVE	Core	15+ workflows
Dashboards & system admin panel	LIVE	Core	All roles + admin dashboard
REST API	LIVE	API	REST only (DRF), browsable endpoint
AI-assisted matching & prediction	NEXT	Future	Recommendation + prediction
GDPR & data protection	NEXT	Future	Privacy compliance
Cloud deployment & scale	NEXT	Next	Ready for migration

Everything is built. Ready for production

The build is complete.

- Every roadmap item is finished — all modules marked done above
- **183 automated tests pass**; system is stable and production-ready
- Identity, trust, CV, projects, jobs, emails, dashboards — all delivered
- Single lightweight deployable stack: **Django + server-side Tailwind**, SQLite today

A proposition: supervised migration

- Migrate to **PostgreSQL** (ready, production-grade database)
- Deploy to **cloud hosting** with HTTPS, backups and scaling
- I propose to **supervise the migration and cloud deployment** end-to-end
- Deliverable: a live, secure, monitored production instance

The project is finished — the next step is putting it into production, and I will drive

Thank you

Everything is finished — and ready for the cloud.

Thank you for your time — happy to answer any questions.
